- Before we discuss what the paper proposes, let's define the goals and constraints of the adversary A.
  - No access to model architecture.
  - MLaaS can output confidence scores.
  - An adversary may be able to make direct queries, providing an arbitrary input x to a model f and obtaining the output f(x).
  - A tries to use the least amount of queries required to estimate f to construct stolen model f1.
- Now let's try to come up with attacks for the most basic ML model, a binary logistic regression model.

Stealing Machine Learning Models

Stealing Machine Learning Models via Prediction APIs

Stealing Machine Learning Models

Stealing Machine Learning Models via Prediction APIs

SyPy Security & Privacy Research Group

- A Logistic Regression (LR) model performs binary classification (c = 2), by estimating the probability of a binary response, based on a number of independent features.

Stealing Machine Learning Models

Stealing Machine Learning Models via Prediction APIs

SyPy Security & Privacy Research Group

- A Logistic Regression (LR) model performs binary classification (c = 2), by estimating the probability of a binary response, based on a number of independent features.
- Let's say the model is trained on a large dataset D.

Stealing Machine Learning Models

Stealing Machine Learning Models via Prediction APIs

SyPy Security & Privacy Research Group

- A Logistic Regression (LR) model performs binary classification (c = 2), by estimating the probability of a binary response, based on a number of independent features.
- Let's say the model is trained on a large dataset D.

Formally, a logistic regression (LR) model is defined by parameters $w \in R^d$ and $\beta \in R$, and it outputs a probability

$$f_1(x) = \sigma(w \cdot x + \beta),$$

where

$$\sigma(t) = \frac{1}{1 + e^{-t}}.$$

Stealing Machine Learning Models

Stealing Machine Learning Models via Prediction APIs

SyPy Security & Privacy Research Group

- A Logistic Regression (LR) model performs binary classification (c = 2), by estimating the probability of a binary response, based on a number of independent features.
- Let's say the model is trained on a large dataset D.

Formally, a logistic regression (LR) model is defined by parameters $w \in R^d$ and $\beta \in R$, and it outputs a probability

$$f_1(x) = \sigma(w \cdot x + \beta),$$

where

$$\sigma(t) = \frac{1}{1 + e^{-t}}.$$

LR is a linear classifier: it defines a hyperplane in the feature space X (defined by

$$w \cdot x + \beta = 0$$

) that separates the two classes.

Stealing Machine Learning Models

Stealing Machine Learning Models via Prediction APIs

SyPy Security & Privacy Research Group

- A Logistic Regression (LR) model performs binary classification (c = 2), by estimating the probability of a binary response, based on a number of independent features.
- Let's say the model is trained on a large dataset D.

Formally, a logistic regression (LR) model is defined by parameters $w \in R^d$ and $\beta \in R$, and it outputs a probability

$$f_1(x) = \sigma(w \cdot x + \beta),$$

where

$$\sigma(t) = \frac{1}{1 + e^{-t}}.$$

LR is a linear classifier: it defines a hyperplane in the feature space X (defined by

$$w \cdot x + \beta = 0$$

) that separates the two classes.

- How to estimate the parameters of this model using the least amount of queries?

Stealing Machine Learning Models

Stealing Machine Learning Models via Prediction APIs

Stealing Machine Learning Models

Stealing Machine Learning Models via Prediction APIs

SyPy Security & Privacy Research Group

Given an oracle sample $(x, f(x))$, we obtain a linear equation

$$w \cdot x + \beta = \sigma^{-1}(f_1(x)).$$

Stealing Machine Learning Models

Stealing Machine Learning Models via Prediction APIs

SyPy Security & Privacy Research Group

Given an oracle sample $(x, f(x))$, we obtain a linear equation

$$w \cdot x + \beta = \sigma^{-1}(f_1(x)).$$

- The shape of w is R^d.

Stealing Machine Learning Models

Stealing Machine Learning Models via Prediction APIs

SyPy Security & Privacy Research Group

Given an oracle sample $(x, f(x))$, we obtain a linear equation

$$w \cdot x + \beta = \sigma^{-1}(f_1(x)).$$

- The shape of w is R^d.
- So d variables here.

Stealing Machine Learning Models

Stealing Machine Learning Models via Prediction APIs

SyPy Security & Privacy Research Group

Given an oracle sample $(x, f(x))$, we obtain a linear equation

$$w \cdot x + \beta = \sigma^{-1}(f_1(x)).$$

- The shape of w is R^d.
- So d variables here.
- One more variable in beta.

Stealing Machine Learning Models

Stealing Machine Learning Models via Prediction APIs

SyPy Security & Privacy Research Group

Given an oracle sample $(x, f(x))$, we obtain a linear equation

$$w \cdot x + \beta = \sigma^{-1}(f_1(x)).$$

- The shape of w is R^d.
- So d variables here.
- One more variable in beta.
- This is a linear equation in d+1 variables.

Stealing Machine Learning Models

Stealing Machine Learning Models via Prediction APIs

SyPy Security & Privacy Research Group

Given an oracle sample $(x, f(x))$, we obtain a linear equation

$$w \cdot x + \beta = \sigma^{-1}(f_1(x)).$$

- The shape of w is R^d.
- So d variables here.
- One more variable in beta.
- This is a linear equation in d+1 variables.
- So, to get an estimate of f1, we need to query the model d+1 times and solve for all the variables.

Stealing Machine Learning Models

A small detour

SyPy Security & Privacy Research Group

- Now that you know how to steal models without having access to model weights.
- How can you steal ChatGPT?
- What are the challenges?
- The estimated training cost of DeepSeek is 5.6 million dollars.
- Let's assume that they distilled ChatGPT.
- But, were they able to do it in just 5.6 million dollars?

- This is because we need large amounts of data to distill a huge model ChatGPT.
- Generating synthetic data for that would require a lot of compute.

> This might be because DeepSeek distilled OpenAI's output. However, there is currently no method to prove this conclusively. One method that is in the early stages of development is watermarking AI outputs. This adds invisible patterns to the outputs, similar to those applied to copyrighted images. There are various ways to do this in theory, but none is effective or efficient enough to have made it into practice.

Stealing Machine Learning Models

Interlude

- Before we move on to the next paper, let's learn some math

Stealing Machine Learning Models

Interlude

Stealing Machine Learning Models

Interlude

$$y = f(x)$$

Stealing Machine Learning Models

Interlude

$$y = f(x)$$

$$y = f(x) = x^2 + 1$$

Stealing Machine Learning Models

Interlude

$$y = f(x)$$

$$y = f(x) = x^2 + 1$$

$$\frac{\partial y}{dx} = 2x$$

Stealing Machine Learning Models

Interlude

$$y = f(x)$$

$$y = f(x) = x^2 + 1$$

$$\frac{\partial y}{dx} = 2x$$

$$y = f(x_1, x_2) = \begin{bmatrix} x_1^2 + x_2^2 \\ x_1 + x_2 \end{bmatrix} = \begin{bmatrix} y_1 \\ y_2 \end{bmatrix}$$

Stealing Machine Learning Models

Interlude

$$y = f(x)$$

$$y = f(x) = x^2 + 1$$

$$\frac{\partial y}{\partial x} = 2x$$

$$y = f(x_1, x_2) = \begin{bmatrix} x_1^2 + x_2^2 \\ x_1 + x_2 \end{bmatrix} = \begin{bmatrix} y_1 \\ y_2 \end{bmatrix}$$

$$J = \begin{bmatrix} \frac{\partial y_1}{\partial x_1} & \frac{\partial y_1}{\partial x_2} \\ \frac{\partial y_2}{\partial x_1} & \frac{\partial y_2}{\partial x_2} \end{bmatrix}$$

Stealing Machine Learning Models

Return of Watermarking

Intro

Return of Watermarking

Intro

- Before we jump into the first black-box watermarking paper, let's review the problems of white-box watermarking schemes.

Return of Watermarking

Intro

- Before we jump into the first black-box watermarking paper, let's review the problems of white-box watermarking schemes.
  - Requires white-box access to verify the watermark.

Return of Watermarking

Intro

- Before we jump into the first black-box watermarking paper, let's review the problems of white-box watermarking schemes.
  - Requires white-box access to verify the watermark.
  - It fails against model extraction
- How do we overcome these problems?

Return of Watermarking

Intro

- Before we jump into the first black-box watermarking paper, let's review the problems of white-box watermarking schemes.
  - Requires white-box access to verify the watermark.
  - It fails against model extraction
- How do we overcome these problems? Ans: Black-box Watermarking

Return of Watermarking

Intro

- Before we jump into the first black-box watermarking paper, let's review the problems of white-box watermarking schemes.
  - Requires white-box access to verify the watermark.
  - It fails against model extraction
- How do we overcome these problems? Ans: Black-box Watermarking
- Before that, let's look at the general flow of a model being deployed using a watermarking scheme.

Return of Watermarking

General Flow

Return of Watermarking

General Flow

1. Procure the dataset required for training the model.

Return of Watermarking

General Flow

1. Procure the dataset required for training the model.
2. Decide what DNN architecture to use for training.

Return of Watermarking

General Flow

1. Procure the dataset required for training the model.
2. Decide what DNN architecture to use for training.
3. Decide what watermarking algorithm to use.

Return of Watermarking

General Flow

1. Procure the dataset required for training the model.
2. Decide what DNN architecture to use for training.
3. Decide what watermarking algorithm to use.
4. Training the model and embedding the watermark.

Return of Watermarking

General Flow

1. Procure the dataset required for training the model.
2. Decide what DNN architecture to use for training.
3. Decide what watermarking algorithm to use.
4. Training the model and embedding the watermark.

- After this, let's say the model got either stolen or leaked through some means.

Return of Watermarking

General Flow

1. Procure the dataset required for training the model.
2. Decide what DNN architecture to use for training.
3. Decide what watermarking algorithm to use.
4. Training the model and embedding the watermark.

- After this, let's say the model got either stolen or leaked through some means.
- Let's say an Adversary A has the stolen model and sets up a competitive service.

Return of Watermarking

General Flow

1. Procure the dataset required for training the model.
2. Decide what DNN architecture to use for training.
3. Decide what watermarking algorithm to use.
4. Training the model and embedding the watermark.

- After this, let's say the model got either stolen or leaked through some means.
- Let's say an Adversary A has the stolen model and sets up a competitive service.
- Now, the model owner O suspects A of stealing the model and goes to a trusted Judge for watermark verification.

Return of Watermarking

General Flow

1. Procure the dataset required for training the model.
2. Decide what DNN architecture to use for training.
3. Decide what watermarking algorithm to use.
4. Training the model and embedding the watermark.

- After this, let's say the model got either stolen or leaked through some means.
- Let's say an Adversary A has the stolen model and sets up a competitive service.
- Now, the model owner O suspects A of stealing the model and goes to a trusted Judge for watermark verification.

1. A's and O's models along with the watermark key is sent to the Judge.

Return of Watermarking

General Flow

1. Procure the dataset required for training the model.
2. Decide what DNN architecture to use for training.
3. Decide what watermarking algorithm to use.
4. Training the model and embedding the watermark.

- After this, let's say the model got either stolen or leaked through some means.
- Let's say an Adversary A has the stolen model and sets up a competitive service.
- Now, the model owner O suspects A of stealing the model and goes to a trusted Judge for watermark verification.

1. A's and O's models along with the watermark key is sent to the Judge.
2. Judge uses the watermark verification algorithm to check if A has stolen from O.

Return of Watermarking

General Flow

1. Procure the dataset required for training the model.
2. Decide what DNN architecture to use for training.
3. Decide what watermarking algorithm to use.
4. Training the model and embedding the watermark.

- After this, let's say the model got either stolen or leaked through some means.
- Let's say an Adversary A has the stolen model and sets up a competitive service.
- Now, the model owner O suspects A of stealing the model and goes to a trusted Judge for watermark verification.

1. A's and O's models along with the watermark key is sent to the Judge.
2. Judge uses the watermark verification algorithm to check if A has stolen from O.
3. Judge gives final verdict.

Return of Watermarking

General Flow

1. Procure the dataset required for training the model.
2. Decide what DNN architecture to use for training.
3. Decide what watermarking algorithm to use.
4. Training the model and embedding the watermark.

- After this, let's say the model got either stolen or leaked through some means.
- Let's say an Adversary A has the stolen model and sets up a competitive service.
- Now, the model owner O suspects A of stealing the model and goes to a trusted Judge for watermark verification.

1. A's and O's models along with the watermark key is sent to the Judge.
2. Judge uses the watermark verification algorithm to check if A has stolen from O.
3. Judge gives final verdict.

- Now that the general flow is clear, before solving the problems of white-box watermarking schemes let's try to define the basic requirements of a watermarking scheme.

Return of Watermarking

Requirements of a functional Watermarking Scheme

Return of Watermarking

Requirements of a functional Watermarking Scheme

1) ***Functionality Preserving***: A watermarked model should have the same utility as the model without a watermark.

Return of Watermarking

Requirements of a functional Watermarking Scheme

1) ***Functionality Preserving***: A watermarked model should have the same utility as the model without a watermark.
2) ***Un-removability***:

Return of Watermarking

Requirements of a functional Watermarking Scheme

SyPy Security & Privacy Research Group

1) ***Functionality Preserving***: A watermarked model should have the same utility as the model without a watermark.
2) ***Un-removability***:
   a) A should not be able to remove the watermark without significantly decreasing the model's utility; making it unusable.

Return of Watermarking

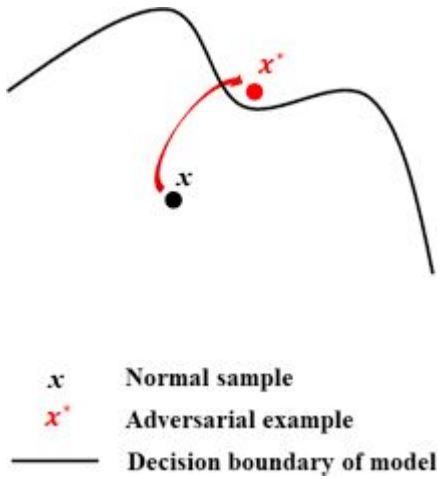
Adversarial Attacks

Recap



- Imagine a decision boundary separating 2-classes.
- A normal sample is far from the decision boundary.
- An adversarial attack calculates the shortest path to cross the decision boundary.
- Because high-dimensional space is weird, "crossing the line" only requires changing the pixel values by a tiny, imperceptible amount.

Return of Watermarking

Recap

SyPy Security & Privacy Research Group

1. Procure the dataset required for training the model.
2. Decide what DNN architecture to use for training.
3. Decide what watermarking algorithm to use.
4. Training the model and embedding the watermark.

- After this, let's say the model got either stolen or leaked through some means.
- Let's say an Adversary A has the stolen model and sets up a competitive service.
- Now, the model owner O suspects A of stealing the model and goes to a trusted Judge for watermark verification.

1. A's and O's models along with the watermark key is sent to the Judge.
2. Judge uses the watermark verification algorithm to check if A has stolen from O.
3. Judge gives final verdict.

- Now that the general flow is clear, before solving the problems of white-box watermarking schemes let's try to define the basic requirements of a watermarking scheme.

- Now, we know that we can't use weights as our watermark key and we want to verify the presence of the watermark in a black-box manner. So where can we place the watermark? Ans: In the input samples.
- How to choose these samples?
  - Simply choose K arbitrary training examples? This approach won't work because any well-trained classifier would classify them correctly. Instead, the samples must be carefully selected so that only O's model can classify them correctly, while any independently trained model is unable to do so.

- Frontier Stitching algorithm heavily relies on the decision boundary not changing for the true adversary samples. This paper came up with a way to smoothen the decision boundary for robust classification, thus making frontier stitching unreliable.

  - Does this watermarking scheme have this property?

Return of Watermarking

Turning Your Weakness Into a Strength: Watermarking Deep Neural Networks by Backdooring(Yossi Adi)

- Non-trivial ownership:
  - an adversary should not be able to claim ownership of the model even if he knows the watermarking algorithm.
  - Does this watermarking scheme have this property?
  - Yes. Because it uses random sampling of images and assigns random labels making the samples uncorrelated to each other.

Return of Watermarking

SyPy Security & Privacy Research Group

- Are the watermarking methods mentioned until now robust to model extraction attacks?
- Let us consider the distributions of the training data and the watermark data.
- Both of them are entirely different.
- When model extraction occurs, the extracted model is only trained on samples similar to the training distribution, but not the watermark distribution.

Return of Watermarking

Interlude

SyPy Security & Privacy Research Group

- Are the watermarking methods mentioned until now robust to model extraction attacks?
- Let us consider the distributions of the training data and the watermark data.
- Both of them are entirely different.
- When model extraction occurs, the extracted model is only trained on samples similar to the training distribution, but not the watermark distribution.
- Thereby, the watermark property is not transferred to the extracted model making all the watermarking schemes weak against such attacks.

(a) Proper trigger

- We choose trigger using SNNL loss.
- We compute the gradient of the **Soft Nearest Neighbor Loss (SNNL)** with respect to the candidate input.

Return of Watermarking

Entangled Watermarks as a Defense against Model Extraction

SyPy Security & Privacy Research Group

- How do we choose the trigger set?
- We start with a set of samples from the training set belonging to a certain class.
- We take these samples, add carefully selected noise and relabel the sample.
- How do we add this noise?
- What are the things that we need to keep in mind before we do this?
  - The trigger must not inadvertently change the underlying content of watermark image so much that it becomes semantically similar to genuine image data.

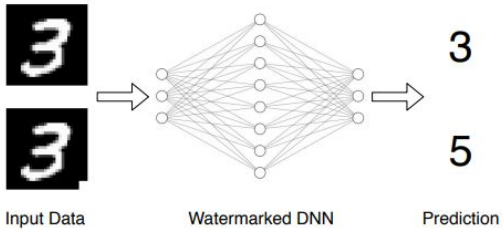
(b) Improper trigger



(a) Proper trigger

- We choose trigger using SNNL loss.
- We compute the gradient of the **Soft Nearest Neighbor Loss (SNNL)** with respect to the candidate input.
- The area with the highest gradient indicates the part of the image that most affects the loss (i.e., the “decision boundary” for the watermark feature).

SyPy Security & Privacy Research Group

- What is the point of doing this?

Return of Watermarking

Entangled Watermarks as a Defense against Model Extraction

SyPy Security & Privacy Research Group

- What is the point of doing this?
- Let's understand why this is good practise using an example.

Return of Watermarking

Entangled Watermarks as a Defense against Model Extraction

SyPy Security & Privacy Research Group

- What is the point of doing this?
- Let's understand why this is good practise using an example.
- Let's say our trigger set consists of training images from the class 1.

Return of Watermarking

Entangled Watermarks as a Defense against Model Extraction

SyPy Security & Privacy Research Group

- What is the point of doing this?
- Let's understand why this is good practise using an example.
- Let's say our trigger set consists of training images from the class 1.
- We select area to add noise (in this case we consider black and white images so we essentially calculate the mask) using SNNL gradient with respect to the input.

Return of Watermarking

Entangled Watermarks as a Defense against Model Extraction

SyPy Security & Privacy Research Group

- What is the point of doing this?
- Let's understand why this is good practise using an example.
- Let's say our trigger set consists of training images from the class 1.
- We select area to add noise (in this case we consider black and white images so we essentially calculate the mask) using SNNL gradient with respect to the input.
- After adding the mask, the image still looks like 1, but has the input distribution of the chosen class.

Return of Watermarking

Entangled Watermarks as a Defense against Model Extraction

SyPy Security & Privacy Research Group

- What is the point of doing this?
- Let's understand why this is good practise using an example.
- Let's say our trigger set consists of training images from the class 1.
- We select area to add noise (in this case we consider black and white images so we essentially calculate the mask) using SNNL gradient with respect to the input.
- After adding the mask, the image still looks like 1, but has the input distribution of the chosen class.
- This way we introduce more entanglement of the watermark distribution with task distribution.

Return of Watermarking

Entangled Watermarks as a Defense against Model Extraction

SyPy Security & Privacy Research Group

- EWE was shown to be effective against model extraction.
- It was also tested against backdoor removal techniques such as NeuralCleanse. And proved to be an effective defense.
- For further testing, EWE was also proved to effective against Fine-pruning, Fine-tuning and Model Pruning.
